Summary

Product-driven staff-level engineer who delivers from ideation through architecture to implementation. Nearly a decade going deep on fintech and insurance workflows and turning that understanding into platforms: a greenfield agency management system, an ACORD form builder, and a partner integration API that let vendors integrate themselves.

Skills

Languages: Go, TypeScript / JavaScript, Python

Frameworks: Node.js, React, event-driven and async services, API design, Protobuf

Infrastructure: AWS, Kubernetes, Terraform, Helm, GitHub Actions

Domains: Insurance, Fintech, Multitenant SaaS, Compliance and sensitive data handling

Experience

Tech Lead, amplo (formerly Veruna), Remote

April 2025 - Present

- Lead the ACORD forms product with a product counterpart and three engineers: set product and technical direction, guide the roadmap, write the RFCs and tickets, and build full stack. Spans ~1,000 distinct standardized forms, live with roughly 6 customers and ramping into a base of ~75 agencies, from five-person shops to national carriers with thousands of employees.
- Built the platform services the greenfield product runs on, all 0 to 1 and each solo from RFC to production in about a month: tenant service, auth, and the Salesforce connector, multitenant from the start.
- Built the release process for the engineering org, taking the product from not shipping at all to per environment deployment on demand.
- Designed the Salesforce connector as a two-layer abstraction over the Salesforce API, mapping their object model onto internal models so either system can change its data model without chained deployments. Also serves API endpoints for use in other services.
- Stood up the infrastructure stack (AWS, Kubernetes, Terraform, Helm) wired into GitHub Actions, with a branching strategy managing sandbox, dev, uat, and prod. SOC 2 compliant from the start.
- Run code and architecture reviews across three product teams, forms plus the sibling Salesforce and ingest teams, to keep output quality consistent.

Tech: Go, Typescript, React, Protobuf, Salesforce, Kubernetes, Terraform, Helm

Principal Engineer & Tech Lead, Hi Marley, Boston, MA
Senior Engineer

August 2023 - March 2025
November 2021 - August 2023

- Promoted to Principal to lead a new partner integrations team, integrating major insurance vendors into the product as first-party experiences and opening a new revenue line.
- Built the first two integrations bespoke, each taking two to four months of full team engineering, then designed a generic integration API and settings layer that dropped partner onboarding to a few days run by product and CX.
- Built Hi Marley's notification platform 0 to 1 in ~3 months, replacing ad hoc text sends with event-driven async microservices (Lambda, SQS, S3, EventBridge) plus a settings layer, so new notification types became a repeatable addition instead of one-off work. Most senior IC on a team of four, mentoring two juniors on AWS.
- Extended the platform with content matching and a trained model, building both the sync and async model serving paths with step functions orchestrating the async side.
- Built under SOC 2 across a customer base of 125+ logos, from local agencies to national insurers, spanning both single and multitenant solutions. PII and sensitive customer data across logging and downstream services was designed in from the start.

Tech: Javascript/Typescript, NodeJS, React, AWS, Serverless, Terraform

Senior Engineer, Capital One, Richmond, VA

December 2020 - October 2021

- Developed and maintained the notification engine sending every outbound notification to Capital One's credit card customers, 1 to 5 million a day, on AWS serverless event-driven infrastructure.
- Took the product over from the contracting team that built it and mentored interns and junior engineers.
- Notifications pulled sensitive card and banking data, so compliance and managing PII across logging and downstream services was a standing design constraint.

Tech: Go, Python, AWS (S3, EventBridge, SQS, Athena, Lambda, Kafka)

Senior Engineer, Testive / A-List Education, Boston, MA

September 2017 - November 2020

- Built products end to end, from an async testing package to test day packet generation to a React Native mobile app, and ran the marketing site and blog in Wordpress alongside the engineering work.
- A-List Education acquired the Testive platform in August 2020.

Tech: Python, Django, Coffeescript, Backbone, React Native, Wordpress

Education

Northeastern University, Boston, MA

College of Computer and Information Science

Bachelor of Science in Computer Science & Game Design, May 2017

Co-ops: Applause (2015), Testive (2016)
